Retrieval-Augmented Translation

Layout evaluation | Test document | October 2026

1. Introduction

Scientific translation must retain document structure.
The reader should preserve paragraphs and figures.
A sentence can span multiple lines without losing words.
The experiment compares two retrieval strategies.

2. Methods

We evaluate translation quality on scientific papers.
Each paragraph is aligned with its original position.
Numerical results and formulas remain unchanged.
The model produces a complete translated paragraph.

Figure 1. Translation quality across four experimental settings.

3. Results and Limitations

The proposed method improves the consistency of translation.
The table reports accuracy and latency for each model.
Mathematical expressions should not be translated as prose.

$$x_i = a_1 + b_2$$

Model	Accuracy	Latency
Baseline model	82.4	1.20
Retrieval model	89.1	0.85

The original PDF is kept intact in the local document library.
